Make videos with Claude MOTION

A ROBONUGGETS GUIDE

How to plan a short video with Claude, turn it into a finished animation, change any word without remaking it, take it to the next level with AI images and video for far less than a subscription, and what to use if your plan doesn't have Motion yet.

README

What this is. The guide to the "Claude can now make animated videos" video, in the same order: Claude Motion from planning your first video to an exported MP4, then taking it to the next level with AI images and video through Kie AI, and what to use if your plan has no Motion: HyperFrames in one prompt, your own review rig and a fair comparison. Plus a bonus: 8 style prompts to try.

How to use it. Page 3 has the whole guide at a glance. Pages 4 to 12 cover Motion itself, from finding it and planning your first video to exporting, plus your own footage and the cost. Pages 13 to 19 take it to the next level with AI images and video for less. Pages 20 to 23 are the options if your plan doesn't have Motion yet. Pages 24 to 26 are the 8 style prompts, and page 27 lists every link. Anything in an orange box is copy-paste ready. The fastest way to start: send this PDF to your AI agent with the prompt below, and it helps you make your first animation on whichever plan you have.

The community. If you want to go further, building AI systems you can sell and mastering Claude Code along the way, that is what we do every week at **skool.com/robonuggets**.

Make your first ANIMATION

Drop this PDF into your AI agent (the Claude app, Claude Code or any agent that can read a PDF) and paste this prompt with it. It works out which option fits your plan, plans the video with you, and changes nothing until you say so.

COPY-PASTE · SEND WITH THIS PDF

```
i've attached a PDF guide to Claude Motion. read it, then help me make my first animation.

- start by asking me what i want to make, who will watch it, where it will play and roughly how long it should be. ask for my logo, prices, numbers, photos, my brand's website or screenshots of a video whose style i like, if they would help
- ask which Claude plan i'm on. if it has Motion (Team or Enterprise), agree the plan with me scene by scene first, then write me one paste-ready Motion prompt in the same shape as the coffee ad prompt in the guide: the look, who watches and where, each scene with its seconds, what to avoid, and what done means
- if my plan doesn't have Motion, take me through the HyperFrames option in the guide instead, and write the prompt for that
- if i want AI pictures or video in it, use the Kie route in the guide, and show me the cost of every picture or clip before you make it
- don't install or connect anything until i say go
```

Six words this guide uses a lot

CLAUDE MOTION
A beta feature in the Claude app. You describe a short video in plain English, and Claude builds it as an animation you can play, edit and export.

STORYBOARD
One still picture per shot, made before anything moves, so you can fix the look and the story first.

MCP
A small program that plugs an outside app, like Kie AI, into Claude. Basically a power adapter.

API KEY
A password that lets Claude spend your credits on a service like Kie. It lives in a file on your computer, never in a chat.

PLUGIN
An add-on for Claude Code that teaches Claude how to use a new tool. HyperFrames installs as one.

PARALLAX
Near things move faster than far things, so flat layers sliding at different speeds look like a 3D camera move.

Facts and prices checked 15 October 2026, prices in US dollars. Claude Motion is in beta, so buttons, names, plan rules and prices can change. Every fact has its source link on the page it appears, and page 27 lists them all.

Claude Motion at a GLANCE

The whole guide on one page, in the video's order. The page number on the right goes deeper.

TOPIC	THE SHORT VERSION	PAGE
What it is	A feature in the Claude app: you describe a short video in plain English, and Claude writes code that animates it. In beta since 8 October 2026.	4
Where to find it	The Artifacts tab, then Motion. Or Output, then Motion, in any chat. Or type `/motion`, or just ask.	4
Who can use it	Team (on by default) and Enterprise (an owner turns it on). Not on Free, Pro or Max yet.	5
How to use it	Agree a plan with Claude in a normal chat first, with reference images, your website or screenshots, then take it into Motion.	6
The coffee ad prompt	The full prompt from the video: the look, who watches, four scenes with their seconds, what to avoid and what done means.	7
What it makes	Animated text, charts, shapes and your own images. No realistic footage and no AI-generated people.	8
Change any word	Tweaks for the words and timing, a comment for one object, or ask in the chat. The rest stays as it was.	9
Share and export	Share sends it to your team with view, comment or edit access. Export, then MP4, saves the file.	10
Your own footage	Motion can't take your video in, so lay its graphics over your footage in your editor.	11
Cost	No extra fee. It counts toward your plan's usage limits, and there's no published number per animation.	12
The next level	Give Claude image and video generation: real-looking shots from AI models, with Motion's editable words on top.	13
What it can look like	A blueprint that turns into a real room, and three image layers that move like a 3D scene.	14
Connect the models	No Higgsfield needed. Kie AI sells GPT Image 2 for about 5 US cents a picture, against about 10 on Higgsfield Plus.	15
Connect Kie	One prompt sets up the free community kie-mcp server in Claude Code and the desktop app.	16
Put them in the scene	Claude makes the picture and the clip first, then builds the animation around them.	18
Storyboard into video	Make one still per shot, then Kling or Seedance brings each to life. About $0.45 to $1.58 a shot on Kie.	19
No Motion yet?	HyperFrames, free and open source, installs in Claude Code with one prompt and opens an editor in your browser.	20
Your own rig	A prompt to build your own little review app, like Jay's RUBRIC Editor.	22
HyperFrames or Motion	The pros and cons: where it runs, cost, setup, editing, your footage and plans.	23
Bonus	8 paste-ready style prompts, from kinetic type to a pop-art comic.	24

HOW TO READ THE YELLOW BOXES

Anything in a yellow box like this one is either what the beta app shows today but Anthropic's help pages don't spell out yet, or a trick we haven't tested on our own account yet. So a name, a button, a price or a plan rule can change. Everything else comes from Anthropic's own pages or the tools' own pages, linked on each page.

What Claude MOTION is

Claude Motion is a feature in the Claude app where you describe a short video in plain English, and Claude builds it as an animation that plays just like a video. It came out in beta on 8 October 2026, alongside Claude Dashboards. It's made for things like a 30-second explainer for a team meeting, an animated chart for a board deck, or a simple promo for your business.

The big difference from AI video models like Kling or Veo is how much control you get. With a video model, you generate the clip from a prompt, and if you don't like it, you generate it again, because you can't reach in and fix just one part, and every new try can change the bits you already liked. Motion writes the video as code, so you change exactly the part you want, like one word or one price, and everything else stays as it was.

Four ways in

1
The Artifacts tab
Click **Artifacts** in the sidebar and pick the **Motion** template. In the beta app it shows as a button at the top, next to **Dashboard**.

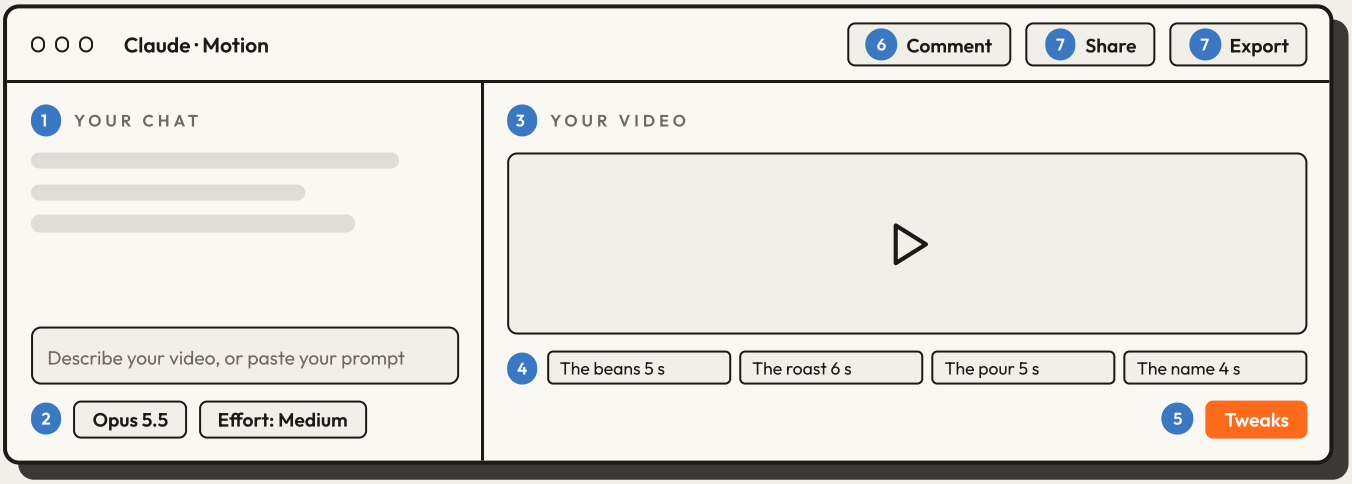

2
The Output menu
In any chat, click **Output** in the message box, then pick **Motion**.

3
The slash command
Type `/motion` in a chat.

4
Just ask
Ask Claude for an animation in plain words, like any other request.

The Motion screen

When it opens, your chat is on the left and the video is on the right, where you also edit it. Every animation is saved in the Artifacts tab, so you can come back to it later.

A simple map of the beta screen, drawn for this guide, not a screenshot. Positions can differ on yours.

1. **Your chat.** Tell Claude what you want, and ask for changes in plain words.
2. **Model and effort.** Picked right under the prompt box.
3. **Your video.** The preview plays the animation.
4. **Scenes.** Lay out along the bottom, each with its seconds.
5. **Tweaks.** Bottom right. Change the words, each scene's length and the speed (page 9).
6. **Comment.** Click it, then click any object in the preview to change just that (page 9).
7. **Share and Export.** Send it to your team, or save an MP4 (page 10).

BETA DETAIL, MAY CHANGE
The Dashboard and Motion buttons, the two panes, the model picker, Tweaks and the comment button are what the beta app shows today. Anthropic documents the Artifacts tab and the Output menu, so those are the steady routes in.

SOURCE Anthropic: Dashboards and Motion (8 Oct 2026): **https://claude.com/resources/articles/dashboards-and-motion**

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

Who can use it TODAY

Claude Motion is still in beta, and right now it's only on Team and Enterprise plans.

On by default · An owner switches it on · Not on this plan yet

Jay expects Anthropic to bring it to more plans soon. That's his view, and Anthropic hasn't given a date, but it makes now a good time to get ahead of it. If you're not on Team or Enterprise, page 20 shows how to make the same kind of video on any paid plan, with Claude Code.

Which option fits your plan

YOUR PLAN	WHAT TO USE	PAGE
Team	Claude Motion. It's switched on by default.	6
Enterprise	Claude Motion, once an owner turns it on in **Organization settings > Artifacts**. Owners can also limit it to certain groups with custom roles.	6
Pro or Max	No Motion yet. Use Claude Code, which comes with your plan, plus HyperFrames.	20
Free	No Motion and no Claude Code. Pro comes with Claude Code, which is the option on page 20.	20

BETA DETAIL, MAY CHANGE
Which plans get Motion is a beta rule, and Anthropic can widen it. Check the Help Centre page below for the latest before you upgrade a plan just for Motion.

Two quick checks if you can't see it

- Check which plan your account is on. Motion only shows on Team and Enterprise.
- On Enterprise, ask your account owner whether Motion is turned on under **Organization settings > Artifacts**, and whether your group is included.

Labels like Organization settings are written as they appear in the Claude app, in US spelling.

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

SOURCE Anthropic: Dashboards and Motion (8 Oct 2026): **https://claude.com/resources/articles/dashboards-and-motion**

How to use it: plan FIRST

The last thing you want is a video that's off-brief. So agree on a plan with Claude in a normal chat, then take it into Motion.

1. Agree a plan in a normal chat

Give Claude your rough idea, and add what it should go by. Then go back and forth until it hands you a detailed prompt with the look, the scenes and their timing. The coffee ad prompt on the next page is what that looks like.

REFERENCE IMAGES
A mood board, a style you like, your logo. JPEG, PNG, GIF or WebP.

YOUR WEBSITE
Paste the link. Claude reads the page when web search is on.

A VIDEO YOU LIKE
Attach screenshots of it. A chat can't take video files.

YOUR OWN FACTS
A price list, a report or numbers, as a PDF, Word, CSV or Excel file.

A chat takes documents and images, up to 20 files of up to 500MB each. Video and audio files aren't on the list.

COPY-PASTE · IN A NORMAL CHAT, TO PLAN YOUR VIDEO

```
help me plan a short video for Claude Motion before we build it. my rough idea: [your idea, like a 20-second ad for my coffee roaster]. i've attached [reference images, or screenshots of a video whose style i like], and my brand's website is [link]. ask me who will watch it, where it will play and how long it should be, then give me one paste-ready prompt with the look (style and exact colours), each scene with its seconds, what to avoid, and what done means. keep the words on screen short.
```

2. Take it into Motion

A
Artifacts, then Motion
Click **Artifacts** in the sidebar, then **Motion**.

B
Type /motion
In any chat, including the one where you made the plan.

C
The Output menu
Click **Output** in the message box, then pick **Motion**.

Then paste in the prompt from your plan.

3. Pick the model, then press go

- **Pick the model and the effort** (how hard Claude thinks) under the prompt box. In the video we used Opus 5.5 on Medium effort. Fable 5.1 is also in the list: on standard Team seats it needs usage credits, while premium Team seats include it up to half of their weekly limits.
- **Press go.** The scenes lay out along the bottom, and in the beta the app says it usually takes 1 to 4 minutes.
- **Because you agreed on the plan first,** the first version comes back much closer to what you had in mind.

SOURCE Claude Help Centre: Fable models on your plan: **https://support.claude.com/en/articles/15424964-claude-fable-models-on-your-plan**

The coffee ad PROMPT

The full prompt from the video, paste-ready, and the kind of prompt your plan-first chat hands you. Ember Roast is made up, so swap in your own name, colours, scenes and price. A risograph print is that grainy two-colour print style where the colours sit slightly out of line.

COPY-PASTE · THE FULL COFFEE AD PROMPT

```
Make a 20-second animated ad for a small-batch coffee roaster called Ember Roast. 1920 x 1080, 30
   frames a second.

The look: a risograph print. Two inks only, warm orange #F26B3A and deep teal #1E5A64, on an
   off-white stock #F3ECDD. Visible grain, flat shapes, and each ink layer printed a few pixels
   off-register, so the colours never quite line up.

Who watches and where: coffee lovers, as an Instagram feed post and on the shop's website.

Scene 1, The beans (5 s): green coffee beans tumble in and settle into a pile.

Scene 2, The roast (6 s): a roasting drum turns, the beans go from green to dark brown, steam
   curls up.

Scene 3, The pour (5 s): coffee pours into a cup and the line "Roasted in small batches" prints
   on.

Scene 4, The name (4 s): "Ember Roast" and "$18 a bag" print in and hold for the last 2 seconds.

Avoid: more than 6 words on screen at once, text near the edges, any fact or logo I haven't given
   you.

Done means: all 4 scenes play in order, every word is readable at phone size, and the name holds
   at the end.
```

The four scenes, 20 seconds

SCENE 1	SCENE 2	SCENE 3	SCENE 4
The beans	**The roast**	**The pour**	**The name**
5 s	6 s	5 s	4 s

Box widths follow the seconds. One idea per scene, and the name holds at the end.

What each line does

FIRST LINE	The job, the length, the size and the frame rate, so Claude knows the canvas before anything else.
THE LOOK	The style, the exact colours as hex codes, and the small details that sell it: the grain and the off-register inks.
WHO WATCHES AND WHERE	Anthropic's own advice: say who will watch it, where it plays and roughly how long it runs.
SCENES 1 TO 4	One idea per scene, each with its seconds. They add up to the full 20.
AVOID	The guardrails, so it doesn't crowd the screen or invent a fact or a logo.
DONE MEANS	How you and Claude both know it's finished.

SOURCE Claude Help Centre: Get started with Claude Motion (who watches, where, how long):
https://support.claude.com/en/articles/17454997-get-started-with-claude-motion

Code, not PIXELS

While Claude builds it, here's what's going on underneath. This is the one idea that explains everything Motion can and can't do.

AN AI VIDEO MODEL
Hands you a finished cake

Every frame is baked in as pixels. If there's a typo on screen, you can't fix just that bit, so you end up ordering a whole new cake, which means generating an entirely new video, and that can cost a lot.

VS

CLAUDE MOTION
Hands you the recipe

Every word, colour, movement and timing is written down as code, and that code plays like a video. So to fix the typo, Claude changes that one line, and the rest comes out identical.

What a recipe can and can't make

Because it's a recipe, it can only use ingredients it can draw. There is no video generation model inside Motion.

CAN ANIMATE	CAN'T MAKE
Text, charts, shapes and your own images.	Realistic footage, or AI-generated people.

There's a workaround, and you don't have to subscribe to another tool like Higgsfield for it. Your own footage goes under Motion's graphics in your editor (page 11), and for real-looking shots you give Claude image and video generation, while Motion does everything on top (page 13).

One change, in recipe form

This is the kind of thing the code describes for each piece on screen, written out in plain words. The client renames the roaster, so one line changes, and every other line stays exactly as it was.

THE NAME, BEFORE

```
text: "Ember Roast"
colour: orange
enter: slides up
hold: 3 s
```

→

THE NAME, AFTER

`text: "Dawn Roast"`	CHANGED
`colour: orange`	SAME
`enter: slides up`	SAME
`hold: 3 s`	SAME

That's the whole trick. With a video model, the same fix means a new cake. With Motion, it's one line, and the beans, the roast and the pour don't move.

What this means for your prompts

- **Be exact.** Give the words on screen, the colours as hex codes and the seconds for each scene. A recipe can follow exact values.
- **Attach anything real.** Your logo, product photos or a chart's numbers, so Motion animates your material instead of drawing a guess.
- **Get real-looking shots separately.** When a scene needs a real place, have an image or video model make it, and let Motion work on top (page 13).

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

SOURCE Anthropic: Dashboards and Motion (8 Oct 2026): **https://claude.com/resources/articles/dashboards-and-motion**

Change any WORD

You can edit two ways: ask Claude in the chat, or edit directly in the editor. In the beta app, the editor has two tools for that, Tweaks and comments.

BETA DETAIL, MAY CHANGE

Tweaks and the comment tool are what the beta app shows today. Anthropic's help pages only say “the editor”, so names and buttons may move. Reviewers also describe pinning a comment to a moment on the timeline instead of an object. If your screen looks different, go by what you see.

Tweaks: words, lengths and speed

Once it's finished, the ad plays through, and in the bottom right there's a button called **Tweaks**. Every word in the current scene is listed. In the video, the client says the name is actually Dawn Roast and a bag is $22 now, so we typed over the old words, and the video updated as we typed. Tweaks also changes each scene's length in seconds, the speed (0.5x, 1x or 2x) and the number of scenes. So a late change from a client is a quick edit, and nothing gets rebuilt.

WAS		TYPED IN TWEAKS
~~Ember Roast~~	→	Dawn Roast
~~$18 a bag~~	→	$22 a bag

The comment tool: one object only

Tweaks covers the words and the timing. For anything without words on it, like the coffee cup, click the little comment button at the top, click the cup right there in the preview, and type the change. Claude works on that one piece only, and when it's done the cup is iced, while the beans, the roast and the name stay exactly as they were. So you can fix one object in a scene you already like, without putting the rest of it at risk.

COPY-PASTE · THE COMMENT, PINNED ON THE CUP

```
make it an iced coffee, with ice cubes
```

Or just ask in the chat

The chat on the left edits too. Name the scene and say exactly what changes, so Claude knows what to leave alone.

COPY-PASTE · AN EDIT IN THE CHAT

```
in scene 3, The pour, make the steam curl up more slowly and hold the line "Roasted in small batches"
for one more second. keep everything else exactly as it is.
```

WORDS ON SCREEN
Tweaks. The video updates as you type.

ONE OBJECT
A comment, pinned on the thing you want changed.

ANYTHING ELSE
Ask in the chat, and say what stays the same.

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

Share and EXPORT

When you're happy with it, send it to your team, then save the actual video file.

Share it with your team

Your animations start out private to you. Open one, click **Share**, add a teammate and pick their access. Give them edit access, and they can make changes to it too, the same way you would share a Google Doc.

ACCESS	WHAT YOUR TEAMMATE CAN DO
Can view	Open it and watch it.
Commenter	Everything above, plus leave comments and download it.
Can edit	Everything above, plus make changes.

On Team and Enterprise, only people signed in to your organisation can open a shared animation, unless an owner turns on link sharing.

BETA DETAIL, MAY CHANGE

Copying the project. In the beta, your team may be able to copy the project and have their own Claude apply edits to it. Anthropic only documents a Copy button for artifacts published from a chat on Free, Pro and Max, so on Team, check your Share menu. Edit access works either way.

Export the MP4

To get the actual video file, click **Export** and choose **MP4**. In the beta app you then pick the resolution, the frame rate and the quality, and it saves straight to your computer.

FORMAT	RESOLUTION	FRAME RATE	QUALITY
MP4	For example 1080p	For example 30 or 60 a second	Higher means a bigger file

So that one file can go on your website, into an email or onto your socials, without you ever opening an editing app.

BETA DETAIL, MAY CHANGE

Or ask Claude to export it. You may be able to just ask in the Motion chat, something like “export this as an MP4 at 1080p”. Anthropic only documents the Export button, and says you can ask Claude to change the animation, not to export it. If the chat can't do it, use the button.

The export settings. Anthropic names MP4 only. The resolution, frame rate and quality settings, and a GIF option, are what the beta app shows, so go by your own Export menu.

SOURCE Claude Help Centre: sharing artifacts (Can view, Commenter, Can edit): **https://support.claude.com/en/articles/9547008**

SOURCE Claude Help Centre: artifacts (Motion exports MP4): **https://support.claude.com/en/articles/17153992**

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

Your own FOOTAGE

Filmed yourself talking? Motion makes the graphics, and your editing app puts them over your footage.

Motion can't take your video in. Anthropic lists your report, data or images as the things you attach, and video isn't on that list. So let Motion make the graphics, like the titles and the price card, and lay them over your footage in your editing app. Your face stays in the video, and the graphics stay editable.

YOU CAN ATTACH	YOU CAN'T ATTACH
Reports, data and images.	Video footage, like your talking clip.

The green background trick

An MP4 can't have a see-through background, so ask Motion for the graphics on a plain green background. Your editor's keying effect, the same tool a green screen uses, cuts the green out, and the card sits over your footage.

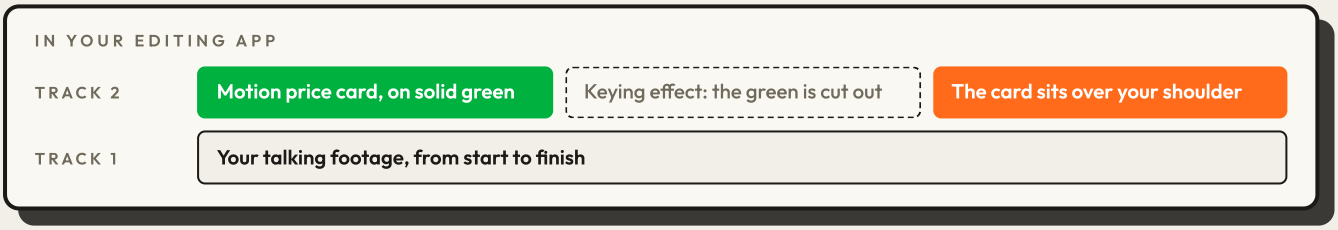

COPY-PASTE · IN THE SAME MOTION CHAT, ONCE THE GRAPHICS LOOK RIGHT

```
Same animation, but on a solid green #00B140 background, nothing else in the frame, so I can key it out in my editor.
```

1
Export on green
Export the green version from Motion as an MP4.

2
Stack it on top
Put it on the track above your talking footage.

3
Key out the green
Add your editor's keying effect, often called chroma key, and pick the green.

BETA DETAIL, MAY CHANGE

The green background trick is plain keying, which common editing apps have, but Anthropic doesn't describe it and we haven't tested it with a Motion export on our own account yet. Try one short clip in your editor before you build a whole video on it, and keep green out of the graphics themselves, or the key cuts those out too.

Graphics built around the footage itself

If you'd rather have the graphics built around your footage, not just laid on top, use HyperFrames in Claude Code (page 20). A HyperFrames video can hold your own video and audio clips, so Claude builds the graphics around them. It's what Jay uses for this.

SOURCE Claude Help Centre: Get started with Claude Motion (what you can attach): **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

SOURCE HyperFrames README (video and audio clips): **https://github.com/heygen-com/hyperframes**

What it COSTS

Short answer: nothing extra, but it isn't unlimited.

$0
EXTRA FEE
If your plan includes Motion, you already have it.

Limits
COUNTS TOWARD THEM
Every animation counts toward your plan's usage limits.

No figure
PER ANIMATION
Anthropic hasn't said how many animations a seat covers.

Anthropic says the longer and more complex the animation, the more of your limit it uses compared with a normal message. So keep an eye on your usage while you're testing, and agree on the plan with Claude in a normal chat first (page 6), because that's the cheap part.

Three ways to spend less of your limit while you test

- **Plan in a normal chat first.** A normal message uses less of your limit than an animation, so fix the story while it's still words.
- **Try the look on a short version.** Longer, more complex animations use more, so test a style at a few seconds before you ask for the full length.
- **Fix small things in place.** Use Tweaks for words and timing, or a comment for one object, so Claude changes one piece instead of remaking the whole video.

What the extras cost, for later

Motion itself costs nothing extra. When you take it to the next level with AI pictures and video (page 13), those come from an outside provider and have their own price. Here's what they cost on Kie AI, the provider this guide uses.

WHAT YOU MAKE, ON KIE	DETAILS	PRICE
One picture	GPT Image 2 at 2K (page 15)	**$0.05**
Five seconds of video	Kling 3.0 at 1080p, no sound (page 19)	**$0.45**
Five seconds of video	Seedance 2.5 at 720p (page 19)	**$1.58**

Kie's prices, checked 15 October 2026, in US dollars. Prices change often, so check before you buy. Kie doesn't sponsor this guide.

SOURCE Claude Help Centre: Get started with Claude Motion (usage limits): **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

SOURCE Kie AI prices: **https://kie.ai/gpt-image-2** · **https://kie.ai/kling-3-0** · **https://kie.ai/seedance-2-5**

Take it to the next LEVEL

Give Claude image and video generation, and your animations get real-looking shots, with Motion's editable words on top.

Everything so far is text, shapes and charts, because that's what Motion can draw on its own. Where it gets really interesting is when you give Claude image and video generation, which basically means connecting it to AI models that make pictures and realistic footage. Then Claude makes the real-looking shots, while Motion still handles the words, the timing and the movement on top. The whole thing starts to look like a proper ad, and every word in it stays editable.

STEP 1 · AN IMAGE OR VIDEO MODEL
Real-looking shots
Pictures and footage Motion can't draw, like a real roastery.

+

STEP 2 · CLAUDE MOTION
Words, timing, movement
Everything on top, still editable in Tweaks.

=

THE RESULT
A proper ad
Real-looking shots, and every word still yours to change.

Two ways to use them

1
Shots first, then the scene
Claude makes the pictures or clips first, then builds the Motion animation around them (page 18).

2
Or the reverse: scenes first, then the shots
Claude makes one still picture per shot as a storyboard, then a video model brings each one to life (page 19).

This part of the guide, in the video's order

WHAT IT CAN LOOK LIKE	p. 14	A blueprint that turns into a real room, and pictures in layers that move like a 3D scene.
CONNECT THE MODELS	p. 15	You don't need Higgsfield. The same models cost less on Kie AI.
CONNECT KIE	p. 16	One prompt sets it all up in Claude Code and the desktop app.
CHECK IT, KEEP IT SAFE	p. 17	Where it works, the setup by hand, and how to keep your key private.
PUT THEM IN THE SCENE	p. 18	A real-looking photo and clip, with Motion's words on top.
STORYBOARD INTO VIDEO	p. 19	Still frames first, then Kling or Seedance makes them move.

BETA DETAIL, MAY CHANGE
Everything in this part leans on Claude reaching your Kie connection (kie-mcp) from the chat you animate in. kie-mcp runs on your own computer, and Anthropic doesn't say whether a Motion chat can use a local server like it, so test it once on your own account (page 17). If it can't, make the pictures in Claude Code or a normal desktop chat, then attach them to Motion, since Motion takes your own images.

SOURCE Claude Help Centre: Get started with Claude Motion (no realistic footage, attach images): **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

What it can look LIKE

Two examples of what it can look like, and the prompt for the second one.

1. Blueprint to real

A blueprint drawing of the roastery fills in until it turns into a real-looking roastery, with the Dawn Roast name printing over it. The real-looking room is one picture from an image model, and the lines, the fill and the name are animation on top, so the words stay editable.

1
The lines draw on
White blueprint lines of the roastery, on blue.

2
It fills in
A scan line sweeps across and reveals the real-looking room.

3
The name prints on
“Dawn Roast” lands on top, still editable.

Bonus prompt 3 on page 24 builds the blueprint part in Motion. Attach a real picture of the room, or have Claude make one through Kie (page 18), to fill it in with.

2. Layers like a 3D scene

Claude makes three pictures of the shop: the back wall, the roasting drum and a bag up front. Motion slides them at different speeds, and because near things move faster than far things, it feels like a camera moving through a 3D scene. That's called parallax. All it takes is asking in plain words.

BACKGROUND	The brick wall with shelves of coffee bags	Slides the least
MIDDLE	The roasting drum, on a transparent background	Slides a bit more
FRONT	The bag of Dawn Roast, on a transparent background	Slides the most

The bars show how far each layer slides during the camera push. The further away, the less it moves.

COPY-PASTE · THE THREE LAYERS, THEN THE ANIMATION

```
Make three images for a parallax shot of a small coffee roastery, 16:9, with the same light and colours
   in all three:
1. Background: the brick wall with shelves of coffee bags, nothing in front of it.
2. Middle: the roasting drum on its own, with a transparent background.
3. Foreground: one bag of coffee labelled "Dawn Roast", with a transparent background.
Then animate them in Motion: slide the three layers at different speeds for a slow camera push in, and
   print "Dawn Roast" on top in the last two seconds.
```

CUT-OUTS COME OUT AT 1K

GPT Image 2 on Kie only makes transparent backgrounds at 1K, so the two cut-out layers come out at 1K.

THE COST ON KIE

Two cut-outs at 1K ($0.03 each) and a background at 2K ($0.05) come to about 11 US cents for the set, checked 15 October 2026.

BETA DETAIL, MAY CHANGE

We haven't tested the layered look in Motion on our own account yet. Try it once with a slow push before you use it for a client. If it looks flat, keep the simple version: Claude makes the pictures, and Motion animates them.

SOURCE Kie AI: GPT Image 2 prices: **https://kie.ai/gpt-image-2**

SOURCE Kie AI docs: GPT Image 2 text to image (transparent at 1K): **https://docs.kie.ai/market/gpt/gpt-image-2-text-to-image**

Connect Claude to the MODELS

A lot of people think you need Higgsfield for AI images and video. You don't. Plenty of providers sell the same models for less, and the one Jay uses is Kie AI.

Kie has GPT Image 2, one of the best image models out there, for about 5 US cents a picture at 2K. On Higgsfield's Plus plan, at $49 a month, the same picture works out at about 10 cents. Kie doesn't sponsor this guide.

One of the best image models, not the best

#1	#2	#3	#4	#5
GPT Image 2.5 Sunburst (max)	GPT Image 2.5 Flare (max)	GPT Image 2 (high)	Nano Banana 2.1	Grok Imagine Image 2.0
Elo 1217	Elo 1207	Elo 1187	Elo 1172	Elo 1166

Artificial Analysis text-to-image leaderboard, read 15 October 2026. On Kie, GPT Image 2.5 costs the same as GPT Image 2 (Kie's prices on 2 October 2026), so you can swap it in for the top spot.

KIE AI · NO PLAN
$0.05 a picture

GPT Image 2 at 2K is 10 credits, and a credit is half a US cent. 1K is $0.03 and 4K is $0.08. You top up what you use, and a failed picture costs nothing.

VS

HIGGSFIELD · PLUS PLAN
About $0.10 a picture

GPT Image 2 at 2K medium is 2 credits. Plus is $49 a month for 1,000 credits, so a picture works out at about 10 cents. Even Ultra, billed yearly, is about 7 cents.

The maths: one GPT Image 2 picture at 2K

WHERE YOU BUY IT	HOW IT ADDS UP	A PICTURE
Kie AI, no plan	10 credits × $0.005	$0.05
Higgsfield Plus, monthly	2 credits × $49 ÷ 1,000 credits	**$0.098**
Higgsfield Plus, yearly	2 credits × $39 a month ÷ 1,000 credits	**$0.078**
Higgsfield Ultra, yearly	2 credits × $99 a month ÷ 3,000 credits	**$0.066**
Higgsfield auto-refill	2 credits, at 18 credits a dollar	**$0.11**

So at 2K medium, Kie is about half the Plus price, cheaper than every Higgsfield plan, and you only pay when you make something. Higgsfield says unlimited generations don't work through its MCP, so inside Claude you pay credits there too.

BETA DETAIL, MAY CHANGE
Kie shows no quality setting, so it doesn't say which quality it runs. At 2K low (0.5 credits), Higgsfield works out cheaper than Kie, and at 2K high (6.5 credits) it's about $0.32 on Plus. Make one picture on each before you decide.

SOURCE Artificial Analysis: text-to-image leaderboard: **https://artificialanalysis.ai/text-to-image/arena/leaderboard-text**

SOURCE Kie AI: GPT Image 2 prices: **https://kie.ai/gpt-image-2** · Higgsfield pricing: **https://higgsfield.ai/pricing**

Connect Kie in one PROMPT

Kie doesn't have an official Claude connector, so the easiest way in is a free community one called kie-mcp. One prompt sets it up.

Paste this prompt into Claude Code. It adds the kie-mcp server to Claude Code and the Claude desktop app, shows you the one file where your Kie API key goes, and caps what any single request can spend. It never asks for your key in the chat.

COPY-PASTE · INTO CLAUDE CODE

```
Set up the free community kie-mcp server so Claude can make images and videos with my Kie AI account. It
   is the npm package kie-mcp (MIT licence, github.com/elibarnett/kie-mcp).
1. Check that Node.js 18 or newer is installed. If it isn't, tell me how to install it and stop there.
2. Add it to Claude Code for my user, pinned to the version I checked:
   claude mcp add kie -s user -e KIE_API_KEY=PASTE_YOUR_KIE_KEY_HERE -e KIE_MAX_CREDITS_PER_CALL=400 --
   npx -y kie-mcp@5.8.0
3. Add the same server to the Claude desktop app's config file (Settings, Developer, Edit Config opens
   it), under "mcpServers": command "npx", args "-y" and "kie-mcp@5.8.0", and the same two env values.
   Keep every server already in that file. On Windows, if plain npx doesn't start, use command "cmd"
   with args "/c", "npx", "-y", "kie-mcp@5.8.0".
4. Never ask me to paste my API key into this chat. Show me the exact file and line where I replace
   PASTE_YOUR_KIE_KEY_HERE with my key from kie.ai/api-key, in each place you added it.
5. Once I've pasted it and restarted Claude, run check_credits to prove it works, then estimate one GPT
   Image 2 picture at 2K with estimate_only before you make anything.
```

What's inside it, in plain words

THE MCP	A small program on your computer that plugs Kie into Claude, like a power adapter. kie-mcp is a community project (one developer, MIT licence), not an official Kie or Anthropic connector.
THE KEY	Your Kie API key is basically a password that lets Claude spend your Kie credits. It lives in a config file on your computer, never in the chat. You get it at kie.ai/api-key.
WHERE IT LIVES	Claude Code's settings and the Claude desktop app's `claude_desktop_config.json`. That's why it works in the desktop app and Claude Code, and not on claude.ai in a browser.
THE CAP	`KIE_MAX_CREDITS_PER_CALL=400` stops any single request that would cost more than 400 credits (about two US dollars). And `estimate_only` prices a job before anything is made.
THE VERSION	`kie-mcp@5.8.0` pins the version that was checked (published 14 October 2026), so an update can't change it under you.
TRUST	Only connect tools you trust, keep the key private, and never show it on screen.

SOURCE kie-mcp, community MCP server for Kie (MIT, v5.8.0): **https://github.com/elibarnett/kie-mcp**

SOURCE kie-mcp on npm: **https://www.npmjs.com/package/kie-mcp**

RESOURCE Kie AI: get your API key: **https://kie.ai/api-key**

Check it, and keep it SAFE

Where kie-mcp works, how to set it up by hand, and how to keep your key private.

WORKS IN
The Claude desktop app and Claude Code, because the server runs on your own computer.

NOT IN
claude.ai in a browser. A website can't start a program on your computer.

Set it up by hand, without Claude Code

In the Claude desktop app, go to **Settings**, then **Developer**, then **Edit Config**. Add this to the file, put your key where it says PASTE_YOUR_KIE_KEY_HERE, and restart the app. If the file already has an "mcpServers" section, add the "kie" part inside it and keep everything else.

COPY-PASTE · CLAUDE_DESKTOP_CONFIG.JSON

```
{
  "mcpServers": {
    "kie": {
      "command": "npx",
      "args": ["-y", "kie-mcp@5.8.0"],
      "env": { "KIE_API_KEY": "PASTE_YOUR_KIE_KEY_HERE", "KIE_MAX_CREDITS_PER_CALL": "400" }
    }
  }
}
```

On Windows, if npx doesn't start, use "command": "cmd" with "args": ["/c", "npx", "-y", "kie-mcp@5.8.0"].

Check that it works

After the restart, ask Claude to run `check_credits`. It should show your Kie balance. Then, before your first picture, ask it to price one GPT Image 2 picture at 2K with `estimate_only`, which works out the cost without making anything.

Keep your key private

- **Only connect tools you trust.** kie-mcp is a community project, so read its page before you install it.
- **Never paste your key into a chat,** and never show it on screen. If it ever leaks, treat it like a leaked password and replace it in your Kie account.
- **Keep the 400-credit cap,** and raise it only when you need a bigger job.
- **What we checked.** We read the code of kie-mcp 5.8.0 without running it. It only talks to Kie's own servers, reads the key from its config and runs no shell commands. That's why the prompt pins that version.

BETA DETAIL, MAY CHANGE
Anthropic doesn't say whether a Motion chat can use a local MCP server like kie-mcp, and we haven't tested it on our own Team account yet. Try it once: in the desktop app, ask a Motion chat to run check_credits. If it can't, make the images and clips in Claude Code or a normal desktop chat, then attach the images to Motion, or lay the clips under Motion's graphics in your editor.

SOURCE kie-mcp README (setup, key, spending cap): **https://github.com/elibarnett/kie-mcp**

RESOURCE kie-mcp directory listing: **https://www.getdrio.com/mcp/io-github-elibarnett-kie-mcp**

Put them in the SCENE

Once Kie is connected, Claude makes the shots first, then builds the animation around them.

For our ad, that's a real-looking photo of the roastery behind the opening scene, and a short clip of beans pouring behind the price, with the Dawn Roast name and the $22 price still animated by Motion on top. So the ad gets real-looking shots, and because the words still come from Motion, you can change any of them in Tweaks without making the footage again.

STEP 1 · THROUGH KIE
The shots
A photo with GPT Image 2, and a clip with Kling 3.0.

→

STEP 2 · CLAUDE MOTION
The ad around them
The photo behind scene 1, the clip behind scene 4, the words on top.

=

THE RESULT
Real shots, editable words
Change "$22" in Tweaks, and the footage holds still.

COPY-PASTE · IN THE CHAT WHERE YOU ANIMATE, ONCE KIE IS CONNECTED

```
Through my Kie connection (kie-mcp), make the shots for my Dawn Roast ad first, then build the Motion
   animation around them.
1. One photo-real picture of the roastery at sunrise with GPT Image 2 at 2K, 16:9, for the opening
   scene.
2. One five-second clip of coffee beans pouring into a bag, with Kling 3.0, 16:9, no sound, for the
   price scene.
3. Before you make anything, run estimate_only for both, show me the cost in US dollars and wait for my
   go.
4. Then build the 20-second ad around them: the picture behind scene 1, the clip behind scene 4, and
   "Dawn Roast" and "$22 a bag" animated on top in the riso inks, so I can still change every word in
   Tweaks.
```

What it costs on Kie

THE SHOT	MODEL AND SIZE	PRICE
The roastery photo	GPT Image 2 at 2K	**$0.05**
The pouring clip	Kling 3.0, five seconds, no sound: $0.35 at 720p, $0.45 at 1080p	**$0.45**
Both shots	Plus one Motion run, which counts toward your plan	About $0.50

Kie's prices, checked 15 October 2026. The estimate_only step in the prompt shows the real cost before anything is made.

BETA DETAIL, MAY CHANGE
This needs Claude to reach kie-mcp from the chat you animate in (page 17), and Anthropic only documents images as things Motion takes in. Building the animation around a clip a connected tool made has only been shown in a public demo. If the clip doesn't go in, put the picture in the scene and lay Motion's graphics over the clip in your editor, with the green background trick on page 11, or build it in HyperFrames (page 20).

SOURCE Kie AI prices: **https://kie.ai/gpt-image-2 · https://kie.ai/kling-3-0**

SOURCE Claude Help Centre: Get started with Claude Motion (what you can attach): **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

Storyboard into VIDEO

Or do it the other way round: make the scenes first as a storyboard, then a video model brings each one to life.

A storyboard is one still picture per shot. Claude makes the frames first, then passes each one to a video model like Kling or Seedance as the first frame of its shot, so they come to life and keep the exact look you picked. The frames are made as stills, so nothing has to come out of Motion, which only exports MP4.

STEP 1 · GPT IMAGE 2
The frames
One still per shot, all in the same look. You check them first.

→

STEP 2 · KLING OR SEEDANCE
The movement
Each frame becomes a five-second shot, with a slow camera move.

=

THE RESULT
Moving shots in your look
Ready to drop into your edit.

Describe the look, never name the studio

Say you want a soft, hand-painted anime look, a bit like a Studio Ghibli film. In your prompt, describe the look by its parts, like soft watercolour light and warm greens and creams, and leave the studio's name out, because some video models refuse a prompt that names one. In our own tests, Kling failed the whole job when a prompt named a brand or a character.

COPY-PASTE · ONCE KIE IS CONNECTED

```
Make a storyboard for my coffee roaster ad, then turn it into video, through my Kie connection (kie-mcp).

1. First make one still picture per shot with GPT Image 2 at 2K, 16:9: [shot 1], [shot 2], [shot 3], [shot 4]. Keep the same look in every frame: a soft, hand-painted anime style, gentle watercolour light, warm greens and creams. Show me the frames and wait for my go.
2. Then turn each frame into a five-second shot with [Kling 3.0 or Seedance 2.5], using the frame as the first image, so the look stays exactly the same.
3. In each video prompt, describe only the movement: one slow camera move and one or two small motions, like steam rising or clouds drifting. No new objects, no text, no logos, and never name a film studio, an artist or a brand.
4. 16:9, no sound, so I can add music in my editor.
5. Before you submit any video, run estimate_only for every shot, show me the cost of each one and the total in US dollars, and wait for my go.
6. Then download every clip into one folder, named shot-01, shot-02 and so on, and list them with their length.
```

Video costs a lot more than pictures

MODEL, ON KIE	PRICE, CHECKED 15 OCT 2026	A 5-SECOND SHOT	RANK
Kling 3.0	$0.07 a second at 720p, $0.09 at 1080p. With sound, $0.10 and $0.135. Clips of 3 to 15 seconds.	**$0.45 at 1080p** **$0.68 with sound**	**#18**
Seedance 2.5	$0.14 a second at 480p, $0.315 at 720p, $0.79 at 1080p. Clips of 4 to 30 seconds. Kie marks these prices as beta.	$1.58 at 720p	**#2**

Rank: Artificial Analysis image-to-video leaderboard (with audio), read 15 October 2026. A four-shot storyboard costs about $0.20 for the frames, then about $1.80 more with Kling 3.0 at 1080p, or about $6.30 more with Seedance 2.5 at 720p. That's why it pays to get the frames right first.

SOURCE Kie AI prices: **https://kie.ai/kling-3-0 · https://kie.ai/seedance-2-5 · https://kie.ai/gpt-image-2**

SOURCE Artificial Analysis: image-to-video leaderboard: **https://artificialanalysis.ai/video/leaderboard/image-to-video**

No Motion yet? HYPERFRAMES

If you're not on Team or Enterprise, don't worry, because you've got alternatives. The same idea, a video written as code, already works in Claude Code, which comes with the Pro and Max plans.

HyperFrames

FREE · OPEN SOURCE · APACHE 2.0

HeyGen's free, open-source video tool: "Write HTML. Render video. Built for agents." It turns a web page into an MP4 on your own computer, and it can hold your own video and audio clips. Free, including for business use, and rendering on your computer uses no HeyGen credits.

A lot of people use it

CHECKED 15 OCTOBER 2026

2,652,201 npm downloads from 13 September to 12 October 2026, over 64,000 GitHub stars, and HeyGen uses it in production. The other route, your own rig, is on page 22.

Set it up in one prompt

HyperFrames installs as a Claude Code plugin, an add-on that teaches Claude how to make videos with it. It isn't an MCP server or a connector. Paste this into Claude Code:

COPY-PASTE · INTO CLAUDE CODE

```
Set up HyperFrames, HeyGen's free, open-source video tool, so you can make and edit videos for me in
   Claude Code.
1. Check that Node.js 22 or newer and FFmpeg are installed. If either is missing, tell me how to install
   it and stop there.
2. Run: claude plugin marketplace add heygen-com/hyperframes
3. Run: claude plugin install hyperframes@hyperframes
4. Run: claude plugin details hyperframes, and check it lists the hyperframes, general-video and
   media-use skills.
5. Tell me to restart Claude Code so the skills load.
6. From then on, whenever I ask for a video, use /hyperframes:hyperframes, render it to MP4, and open
   the preview with npx hyperframes preview, so I can scrub through it and change things in HyperFrames
   Studio.
```

What's inside it, in plain words

THE PLUGIN	An add-on for Claude Code with three skills, hyperframes, general-video and media-use, that teach Claude how to build and render HyperFrames videos. You call it with `/hyperframes:hyperframes`.
TWO FREE TOOLS	Node.js 22 or newer and FFmpeg. Rendering runs on your computer and uses no HeyGen credits.
THE EDITOR	`npx hyperframes preview` opens HyperFrames Studio in your browser (page 21).
IF IT FAILS	If Claude Code can't run the two `claude plugin` lines itself, type them in a terminal, or run `npx skills add heygen-com/hyperframes` in your project folder and pick Core Skills.

SOURCE HyperFrames docs: the Claude Code plugin: **https://hyperframes.heygen.com/guides/plugins**

SOURCE HyperFrames (HeyGen, Apache 2.0): **https://github.com/heygen-com/hyperframes**

SOURCE HyperFrames npm downloads, last month: **https://api.npmjs.org/downloads/point/last-month/hyperframes**

Then just ASK

Once the plugin is in and Claude Code has restarted, ask in plain words. Claude drives HyperFrames for you: it writes the video as code, renders it, and opens the editor.

COPY-PASTE · THE SHORT VERSION, FROM THE VIDEO

```
Make a twenty-second riso-style ad for my coffee roaster.
```

COPY-PASTE · THE FULL VERSION, WITH THE COFFEE AD PROMPT

```
Make this video with HyperFrames and render it to an MP4: [paste the full coffee ad prompt from page 7].
When it's done, open the preview with npx hyperframes preview so I can scrub through it.
```

The editor: HyperFrames Studio

`npx hyperframes preview` opens your video in HyperFrames Studio, in your browser, with live reload. HyperFrames calls Studio a browser surface for previewing and editing your video: you scrub through it and change things yourself, and when Claude changes the code, the preview updates. HeyGen marks it as available and still evolving, so expect it to change.

SCRUB
Move through the video second by second.

EDIT
Change things in the browser, or ask Claude.

LIVE RELOAD
Every change from Claude shows up straight away.

BETA DETAIL, MAY CHANGE

There's also a HyperFrames Studio desktop app, “the video editor built for agents”, for macOS and Linux, where you and your coding agent work on the same project and timeline. A third-party listing says the Windows version is still pending, so on Windows, use the browser Studio.

Your own footage goes in too

A HyperFrames video can hold your own video and audio clips, so Claude builds the graphics around your real footage, not just on top of it (page 11). That's the big thing Motion can't do yet.

Claude Code's own usage still counts toward your plan, so this is the same kind of video without paying for another tool, not a free one.

Remotion does a similar job in Claude Code. It's free for individuals, for-profit companies with up to 3 employees and non-profits, and bigger companies need a paid company licence.

SOURCE HyperFrames docs: quickstart and the preview: **https://hyperframes.heygen.com/quickstart**

SOURCE HyperFrames Studio, the desktop app: **https://hyperframes.heygen.com/**

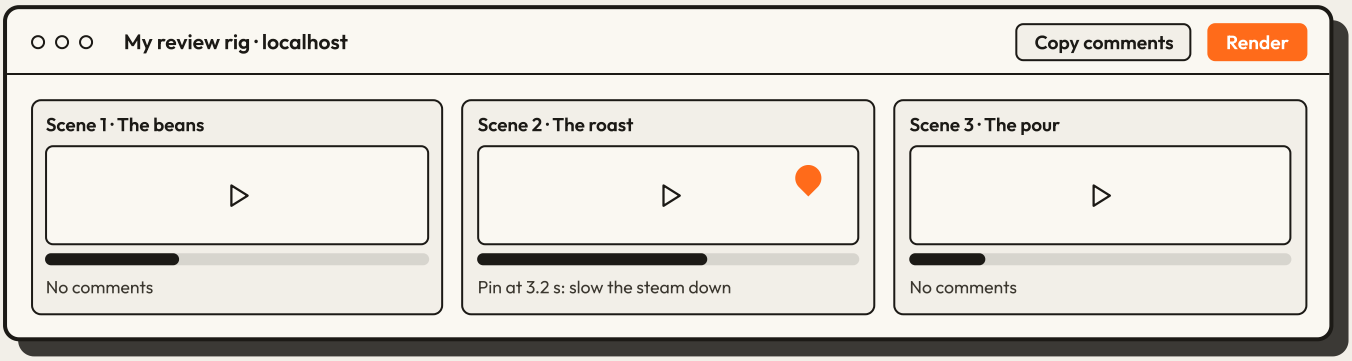

REVIEW Third-party listing (Windows pending): **https://futuretools.io/tools/hyperframes-studio-1b6f0bfa**

SOURCE Remotion licence: **https://github.com/remotion-dev/remotion/blob/main/LICENSE.md**

Or build your own RIG

Another route is your own local rig: basically your own little editing app that runs on your computer.

This is what Jay does. His rig is RUBRIC Editor, part of the tools we build for the RoboNuggets community. On top of the motion graphics, it lets him edit around raw footage of a person talking, and it gives him the exact cuts for each video. To get started on your own, paste the prompt below into Claude Code. You end up with an editor that works exactly the way you do.

A simple map of what the prompt builds, drawn for this guide.

COPY-PASTE · INTO CLAUDE CODE, TO BUILD YOUR OWN RIG

```
Build me a small video review app that runs on my computer, for the animations I make with HyperFrames in
   Claude Code.
- A homepage that lists every project in [my projects folder], newest first.
- Inside a project, one card per scene, with the rendered clip, a play button and a scrubber.
- Click anywhere on a clip to drop a comment pin at that second and that spot. Comments save to a
   comments.json file in that project, so nothing is lost when I close it.
- A "Copy comments" button that copies every open comment as one prompt I can paste back to Claude, with the
   scene, the second and what to change.
- A "Render" button that runs the HyperFrames render for that scene and reloads the clip when it's done.
- It runs on localhost, never opens a browser tab by itself, and never moves or deletes my files.
Build it in plain HTML, CSS and JavaScript with a small Node server, tell me the one command that starts it,
   and test it on one of my projects before you tell me it's done.
```

WHAT THE PROMPT BUILDS

The review side: one card per scene, comment pins at a second and a spot, Copy comments for Claude, and Render.

WHAT JAY'S RUBRIC EDITOR ADDS

Editing around raw footage of a person talking, and the exact cuts for each video. Grow your own rig the same way, one ask at a time.

HyperFrames or Claude MOTION

Here are the pros and cons, row by row.

	Claude Motion	HyperFrames, in Claude Code
WHERE IT RUNS	In Anthropic's cloud, inside the Claude app. Nothing to install.	On your own computer.
COST	No extra fee. Counts toward your plan's usage limits.	The tool itself is free (Apache 2.0). Claude Code's usage counts toward your plan.
SETUP	None.	One-time: the plugin, plus Node.js 22 or newer and FFmpeg.
EDITING	Tweaks and comments in the beta editor, or ask Claude in the chat.	Ask Claude, or change things yourself in HyperFrames Studio.
YOUR OWN FOOTAGE	No. Motion takes your reports, data and images, not video.	Yes. It holds your own video and audio, and builds the graphics around them.
PLANS	Team and Enterprise, in beta.	Any plan with Claude Code, including Pro and Max.

THE VERDICT

Have Motion? Use it for quick promos. **For everything else,** HyperFrames gets you there.

Pick by the job

A QUICK PROMO	p. 6	Plan it in a chat, then your words, prices and images, made in minutes: Claude Motion.
OVER YOUR FOOTAGE	p. 11	Motion's graphics on green, keyed out in your editor.
REAL-LOOKING SHOTS	p. 18	A photo and a clip from Kie, with Motion's editable words on top.
MOVING SHOTS IN YOUR LOOK	p. 19	Storyboard frames first, then Kling or Seedance makes them move.
AROUND YOUR FOOTAGE	p. 20	Graphics built around your real video: HyperFrames.
YOUR OWN REVIEW APP	p. 22	Your own rig, built with one prompt in Claude Code.

BETA DETAIL, MAY CHANGE

Reviewers report that Motion runs in Anthropic's cloud and needs "Cloud code execution and file creation" switched on under Capabilities. Anthropic's Motion help page doesn't spell that out. If Motion doesn't show for you on Team or Enterprise, that switch is worth checking.

SOURCE HyperFrames README (local render, preview, video and audio): **https://github.com/heygen-com/hyperframes**

SOURCE Claude Help Centre: Get started with Claude Motion: **https://support.claude.com/en/articles/17454997-get-started-with-claude-motion**

REVIEW A third-party Claude Motion review (the cloud switch): **https://www.eesel.ai/blog/claude-motion-review**

Bonus: 8 style PROMPTS

Eight looks to try in Motion, each one paste-ready on its own in a new chat. Every brand, person and number in them is made up, so swap in your own. Each one asks for a three-line plan before it builds, so you can check the story first.

1 Kinetic type hook

8 SECONDS

Good for a hook, or the first seconds of a promo.

COPY-PASTE

```
Make an 8-second Claude Motion animation: a kinetic type hook. Loud brutalist typography on near-black (#0b0b0b) with acid yellow (#e8ff3a), off-white (#f4f1ea) and one hot orange (#ff5a1f). Huge heavy uppercase words slam in about every half second with a little overshoot and a slight camera shake: "CLAUDE JUST DROPPED", then "MOTION." filling the screen on yellow, "PROMPT IN." then "VIDEO OUT.", "EDIT EVERY WORD." on orange, ending on a clean "Claude Motion" lockup with a small BETA tag. No glitch effects and no one-frame flashes. 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

2 Risograph coffee ad

10 SECONDS

Good for a product ad with a print-shop feel.

COPY-PASTE

```
Make a 10-second Claude Motion animation: a four-scene ad for a made-up small-batch roaster called Dawn Roast, in a two-ink risograph print look. Cream paper (#f3ead8) with grain, only a pink-red (#ff4d6d) and a teal (#1f7a8c) that overprint into a darker third tone, halftone dot shading, ink layers a couple of pixels off-register. Scenes: "The beans." with beans tumbling into a kraft bag with a stamp label, "The roast." with a drum roaster turning and a thermometer climbing, "The pour." with a gooseneck kettle pouring into a cup and steam curling up, then "DAWN ROAST" stamped huge with "Wake up slowly." and "$22 a bag". Print-style wipes between scenes, never soft fades. 16:9, with the seconds for each scene. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

3 Blueprint to real

8 SECONDS

Good for before and after, or an idea becoming the real thing.

COPY-PASTE

```
Make an 8-second Claude Motion animation: blueprint to real. A white line drawing of a small coffee roastery draws itself on a deep blue blueprint grid (#0d2b52): a brass drum roaster on the left, a round cooling tray on the right, coffee sacks and shelves at the back, with dimension lines and small labels "roaster, 12 kg", "cooling tray", "sacks". Then a bright scan line sweeps across and fills the drawing in behind it as a rich, full-colour illustration of the same room, warm brass, copper and wood with soft shading, lined up exactly under the lines, with a slow push in. "Now it's real." lands big in the corner with two small pill tags: "REAL FOOTAGE - AI video tool" and "TEXT + ANIMATION - Claude Motion". Hold the finished scene for at least 2.5 seconds. 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

Motion can't make realistic footage, so this version fills in with an illustration. For a real photo, attach your own (Motion animates your images), or have Claude make one through Kie first (page 18).

4 Chalkboard

9 SECONDS

Good for explaining how something works with an analogy.

COPY-PASTE

```
Make a 9-second Claude Motion animation in a chalkboard style: a dark green chalkboard (#1f3a2e) with smudged eraser marks, everything drawn on in white, soft yellow and dusty pink chalk with slightly wobbly hand-drawn lines. The left side, headed "A VIDEO MODEL", draws a slice of cake with "you get the cake" under it. The right side, headed "CLAUDE MOTION", draws a recipe card with four lines: "text: DAWN ROAST", "colour: pink", "enter: drop in", "hold: 4 s", plus a small coffee cup, with "you get the recipe" under it. Then a chalk circle goes round "colour: pink", it's rubbed out and rewritten as "colour: teal", a little oven says "bake again", and only the cup turns teal while everything else stays exactly where it was. End on "Change one line. Bake again." 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

5 Isometric

8 SECONDS

Good for comparing two options side by side.

COPY-PASTE

```
Make an 8-second Claude Motion animation: a soft pastel isometric scene (sky blue #a9d4ff, lilac #c9b6ff, peach #ffcfa8, mint #b8f0d6, deep ink #2a2540 outlines) with long shadows. Two floating platforms pop in one piece at a time. Left: a cloud over a stack of server racks, a progress bar that fills fast to a green tick, labelled "CLAUDE MOTION, made in the Claude app" with a "no setup" tag. Right: a desk with a laptop whose fan spins, a slower progress bar, labelled "HYPERFRAMES or REMOTION, renders on your computer" with a "one-time setup" tag. A paper plane carrying the prompt flies to each one in turn, and the camera settles on a wide view. 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

6 8-bit player select

7 SECONDS

Good for who gets what: plans, tiers or options.

COPY-PASTE

```
Make a 7-second Claude Motion animation: an arcade character-select screen in crisp pixel art on deep navy (#0b1020) with cyan, magenta, yellow and green, faint scanlines and a dot-matrix font. Title "WHO CAN USE CLAUDE MOTION?" with a BETA badge. Four player cards: PRO and MAX padlocked and greyed out with "NOT YET", TEAM lit up with a green tick and "ON BY DEFAULT", ENTERPRISE starts locked until an OWNER switch flips and it lights up "OWNER TURNS IT ON". A blinking selector hops between the cards, ending on "TEAM + ENTERPRISE ONLY (FOR NOW)". 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

7 Hand-drawn sketchnote

12 SECONDS

Good for explaining a process, or who does what in a team.

COPY-PASTE

```
Make a 12-second Claude Motion animation in a hand-drawn sketchnote style: warm cream paper (#f6efe0) with black pen lines that draw themselves on, soft marker fills in coral (#ff8a6b), sky blue (#7cc4ff) and sunshine yellow (#ffd45c), a highlighter swipe under key words and little doodle sparkles. Heading "A PROJECT IS A SMALL TEAM". Then in order: a clipboard "YOU SET THE JOB" with "Goal: one-page client report" and "Done = every figure matches the data", an arrow to a little desk with a doodled person labelled "COORDINATOR: plans, hands out work, checks", three worker folders under it labelled "PULL THE NUMBERS", "WRITE THE SUMMARY" and "CHECK THE FIGURES" with "own session, own tools", curved arrows back up marked "report back", and a clipboard with ticks "YOU REVIEW". Footer "Open any thread to steer it." The camera follows each part as it's drawn, then pulls back to the whole page. 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

8 Pop-art comic

8 SECONDS

Good for a problem and its fix, in three beats.

COPY-PASTE

```
Make an 8-second Claude Motion animation: a comic page with halftone dots, thick black outlines, flat red (#ff3b30), yellow (#ffd400) and blue (#1e63ff), yellow caption boxes and bold comic lettering. Three panels pop in one after another with a little bounce. Panel 1: a smiling cloud character in a hard hat holding a scroll "THE SKILL" and a wrench, caption "THE CLOUD THREAD IS ON THE JOB". Panel 2: it reaches for a database labelled "content.db (on the boss's laptop)" behind a glass wall, speech bubble "UH... WHERE IS IT?!" and a starburst "NOPE!", caption "MEANWHILE, THE FILE LIVES ONLY ON YOUR COMPUTER". Panel 3: a laptop with a little signal icon beams a bridge up to the cloud, speech bubble "RUN IT LOCAL!" and a green tick, caption "FIX: RUN THAT THREAD LOCALLY WITH REMOTE CONTROL". 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

Write your own style prompt

Every prompt above has the same five parts. Fill in the brackets for a look of your own, and attach your logo or photos so Motion animates your real material. Each finished one edits like the coffee ad: Tweaks for the words, a comment for one object.

COPY-PASTE · THE TEMPLATE

```
Make a [length]-second Claude Motion animation in a [style] style: [the background and the colours, with hex codes, plus the texture or details that sell the look]. [What appears, in order, scene by scene, with the exact words on screen]. [How things move: slam in, draw on, pop in, wipe]. End on [the last frame and how long it holds]. 16:9, split into short scenes with the seconds for each. Smooth eased movement, every key moment holds still for at least a second so it can be read, and big readable text with no tiny labels. Before you build it, give me its plan in three lines: the look, the scenes with their seconds, and what done looks like. Then build it straight away.
```

MORE

skool.com/robonuggets - the RoboNuggets community

Where this goes NEXT

The easy part is the prompt. One good paragraph gets you a finished animation. The skill that pays is building the system around it: briefs that come out right the first time, your own look and material in every video, images and video at the right price, and promos you can make for yourself and for the clients you sell to.

That is what we practise every week in the RoboNuggets community: building AI systems you can sell, and mastering Claude Code and Claude Design along the way.

YOUR NEXT THREE MOVES

1. Send this PDF to your agent with the prompt on page 2, and make your first animation.

2. Plan a promo for a real business in a normal chat (page 6), then connect Kie (page 16) when you want AI images or video in it.

3. Come and build the rest with us.

skool.com/robonuggets

The video in five lines

ONE PARAGRAPH IN	p. 7	Plan it with Claude, and one good prompt gets you a finished animation.
CHANGE ONE WORD	p. 9	Tweaks for the words, a comment for one object, and the rest stays put.
YOUR FOOTAGE	p. 11	Motion's graphics on green, laid over your footage in your editor.
IMAGES AND VIDEO FOR LESS	p. 15	GPT Image 2, Kling and Seedance on Kie, with no subscription.
NO MOTION YET	p. 20	HyperFrames in Claude Code, on any plan with Claude Code.

Every source and resource in this guide is listed on page 27.
